

Deep Generative Models

Lecture 6

Roman Isachenko

Ozon Masters

Spring, 2021

- ▶ Modern neural networks are trained via backpropagation.
- ▶ Residual networks are state of the art in image classification.
- ▶ Backpropagation requires storing the network activations.

Problem

Storing the activations imposes an increasing memory burden. GPUs have limited memory capacity, leading to constraints often exceeded by state-of-the-art architectures (with thousand layers).

NICE

$$\begin{cases} \mathbf{z}_1 = \mathbf{x}_1; \\ \mathbf{z}_2 = \mathbf{x}_2 + \mathcal{F}(\mathbf{x}_1, \boldsymbol{\theta}); \end{cases} \Leftrightarrow \begin{cases} \mathbf{x}_1 = \mathbf{z}_1; \\ \mathbf{x}_2 = \mathbf{z}_2 - \mathcal{F}(\mathbf{z}_1, \boldsymbol{\theta}). \end{cases}$$

RevNet

$$\begin{cases} \mathbf{y}_1 = \mathbf{x}_1 + \mathcal{F}(\mathbf{x}_2, \boldsymbol{\theta}); \\ \mathbf{y}_2 = \mathbf{x}_2 + \mathcal{G}(\mathbf{y}_1, \boldsymbol{\theta}); \end{cases} \Leftrightarrow \begin{cases} \mathbf{x}_2 = \mathbf{y}_2 - \mathcal{F}(\mathbf{y}_1, \boldsymbol{\theta}); \\ \mathbf{x}_1 = \mathbf{y}_1 - \mathcal{G}(\mathbf{x}_2, \boldsymbol{\theta}). \end{cases}$$

Architecture	CIFAR-10 [15]		CIFAR-100 [15]	
	ResNet	RevNet	ResNet	RevNet
32 (38)	7.14%	7.24%	29.95%	28.96%
110	5.74%	5.76%	26.44%	25.40%
164	5.24%	5.17%	23.37%	23.69%

- ▶ If the network contains non-reversible blocks (poolings, strides), activations for these blocks should be stored.
- ▶ To avoid storing activations in the modern frameworks, the backward pass should be manually redefined.

Hypothesis

The success of deep convolutional networks is based on progressively discarding uninformative variability about the input with respect to the problem at hand.

- ▶ It is difficult to recover images from their hidden representations.
- ▶ Information bottleneck principle: an optimal representation must reduce the MI between an input and its representation to reduce uninformative variability + maximize the MI between the output and its representation to preserve each class from collapsing onto other classes.

Hypothesis

The success of deep convolutional networks is based on progressively discarding uninformative variability about the input with respect to the problem at hand.

Idea

Build a cascade of homeomorphic layers (i-RevNet), a network that can be fully inverted up to the final projection onto the classes, i.e. no information is discarded.

i-RevNet, 2018

Gaussian autoregressive model

Consider autoregressive model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}),$$

with conditionals

$$p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}) = \mathcal{N}(\hat{\mu}_i(\mathbf{x}_{1:i-1}), \hat{\sigma}_i^2(\mathbf{x}_{1:i-1})).$$

Sampling

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

Sampling from autoregressive model is sequential.

Note that we could interpret this sampling as a transformation $\mathbf{x} = g(\mathbf{z}, \boldsymbol{\theta})$, where \mathbf{z} comes from base distribution $\mathcal{N}(0, 1)$.

Gaussian autoregressive model

Sampling

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

Jacobian

$$\log \left| \det \left(\frac{\partial f(\mathbf{x}, \boldsymbol{\theta})}{\partial \mathbf{x}} \right) \right| = -\log \left| \det \left(\frac{\partial g(\mathbf{z}, \boldsymbol{\theta})}{\partial \mathbf{z}} \right) \right| = -\sum_{i=1}^m \log \hat{\sigma}_i(\mathbf{x}_{1:i-1}).$$

Inverse transform

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

We get an autoregressive model with tractable (triangular) Jacobian, which is easily invertible. It is a flow!

Inverse autoregressive flow (IAF)

Gaussian autoregressive model ($\mathbf{z} \rightarrow \mathbf{x}$)

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

This process is sequential.

Let use the following reparametrization: $\sigma = \frac{1}{\hat{\sigma}}$; $\mu = -\frac{\hat{\mu}}{\hat{\sigma}}$.

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

$$x_i = (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

This process is **not** sequential.

Inverse autoregressive flow (IAF)

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

$$x_i = (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

Inverse autoregressive flow use such inverted autoregressive model as a flow in VAE:

$$\mathbf{z}_0 = \boldsymbol{\sigma}(\mathbf{x}) \cdot \boldsymbol{\epsilon} + \boldsymbol{\mu}(\mathbf{x}), \quad \boldsymbol{\epsilon} \sim \mathcal{N}(0, 1); \quad \sim q(\mathbf{z}_0 | \mathbf{x}, \phi).$$

$$\mathbf{z}_k = \boldsymbol{\sigma}_k(\mathbf{z}_{k-1}) \cdot \mathbf{z}_{k-1} + \boldsymbol{\mu}_k(\mathbf{z}_{k-1}), \quad k \geq 1; \quad \sim q_k(\mathbf{z}_k | \mathbf{x}, \phi, \{\phi_j\}_{j=1}^k).$$

Flows

- ▶ Inference mode in autoregressive flows is used for density estimation tasks.
- ▶ Generation mode in autoregressive flows (IAF) is used for stochastic variational inference to get a more flexible posterior distribution.

Inverse autoregressive flow (IAF)

(a) Prior distribution

(b) Posteriors in standard VAE

(c) Posteriors in VAE with IAF

Kingma D. P. et al. *Improving Variational Inference with Inverse Autoregressive Flow*, 2016

Gaussian autoregressive model

Consider autoregressive model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}),$$

with conditionals

$$p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}) = \mathcal{N}(\hat{\mu}_i(\mathbf{x}_{1:i-1}), \hat{\sigma}_i^2(\mathbf{x}_{1:i-1})).$$

Forward and inverse

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

Gaussian autoregressive model

Forward and inverse

$$\mathbf{x} = g(\mathbf{z}, \boldsymbol{\theta}); \quad x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}), \quad z_i \sim \mathcal{N}(0, 1).$$

$$\mathbf{z} = f(\mathbf{x}, \boldsymbol{\theta}); \quad z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

Jacobian

$$\log \left| \det \left(\frac{\partial f(\mathbf{x}, \boldsymbol{\theta})}{\partial \mathbf{x}} \right) \right| = -\log \left| \det \left(\frac{\partial g(\mathbf{z}, \boldsymbol{\theta})}{\partial \mathbf{z}} \right) \right| = -\sum_{i=1}^m \log \hat{\sigma}_i(\mathbf{x}_{1:i-1}).$$

We get an autoregressive model with tractable (triangular) Jacobian, which is easily invertible. It is a flow!

Inverse autoregressive flow (IAF)

Gaussian autoregressive model ($\mathbf{z} \rightarrow \mathbf{x}$)

$$\begin{aligned}x_i &= \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}). \\z_i &= (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.\end{aligned}$$

This process is sequential.

Let use the following reparametrization: $\sigma = \frac{1}{\hat{\sigma}}$; $\mu = -\frac{\hat{\mu}}{\hat{\sigma}}$.

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$\begin{aligned}z_i &= \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}). \\x_i &= (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.\end{aligned}$$

This process is **not** sequential.

Kingma D. P. et al. *Improving Variational Inference with Inverse Autoregressive Flow*, 2016

Inverse autoregressive flow (IAF)

Gaussian autoregressive model

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

Inverse transform

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})};$$

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$

Inverse autoregressive flow

$$x_i = \sigma_i(\mathbf{z}_{1:i-1}) \cdot z_i + \mu_i(\mathbf{z}_{1:i-1}).$$

Flows

- ▶ Inference mode in autoregressive flows is used for density estimation task.
- ▶ Generation mode in autoregressive flows (IAF) is used for stochastic variational inference to get more flexible posterior distribution.

Inverse autoregressive flow (IAF)

Inverse transform ($\mathbf{x} \rightarrow \mathbf{z}$)

$$z_i = \sigma_i(\mathbf{x}_{1:i-1}) \cdot x_i + \mu_i(\mathbf{x}_{1:i-1}).$$
$$x_i = (z_i - \mu_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{x}_{1:i-1})}.$$

Inverse autoregressive flow use such inverted autoregressive model as a flow in VAE:

$$\mathbf{z}_0 = \sigma(\mathbf{x}) \cdot \epsilon + \mu(\mathbf{x}), \quad \epsilon \sim \mathcal{N}(0, 1); \quad \sim q(\mathbf{z}_0 | \mathbf{x}, \phi).$$

$$\mathbf{z}_k = \sigma_k(\mathbf{z}_{k-1}) \cdot \mathbf{z}_{k-1} + \mu_k(\mathbf{z}_{k-1}), \quad k \geq 1; \quad \sim q_k(\mathbf{z}_k | \mathbf{x}, \phi, \{\phi_j\}_{j=1}^k).$$

Inverse autoregressive flow (IAF)

(a) Prior distribution

(b) Posteriors in standard VAE

(c) Posteriors in VAE with IAF

Kingma D. P. et al. *Improving Variational Inference with Inverse Autoregressive Flow*, 2016

Masked autoregressive flow (MAF)

Gaussian autoregressive model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}) = \prod_{i=1}^m \mathcal{N}(x_i|\mu_i(\mathbf{x}_{1:i-1}), \sigma_i^2(\mathbf{x}_{1:i-1})) .$$

We could use MADE (masked autoencoder) as conditional model.
The sampling order could be crucial.

Samples from the base distribution could be an indicator of how good the flow was fitted.

Papamakarios G., Pavlakou T., Murray I. Masked Autoregressive Flow for Density Estimation, 2017

Masked autoregressive flow (MAF)

Gaussian autoregressive model

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{i=1}^m p(x_i|\mathbf{x}_{1:i-1}, \boldsymbol{\theta}) = \prod_{i=1}^m \mathcal{N}(x_i|\mu_i(\mathbf{x}_{1:i-1}), \sigma_i^2(\mathbf{x}_{1:i-1})) .$$

MAF is just a stacked MADE model.

MAF vs IAF

Sampling and inverse transform in MAF

$$x_i = \hat{\sigma}_i(\mathbf{x}_{1:i-1}) \cdot z_i + \hat{\mu}_i(\mathbf{x}_{1:i-1}).$$

$$z_i = (x_i - \hat{\mu}_i(\mathbf{x}_{1:i-1})) \cdot \frac{1}{\hat{\sigma}_i(\mathbf{x}_{1:i-1})}.$$

- ▶ Sampling is slow (sequential).
- ▶ Density estimation is fast.

Sampling and inverse transform in IAF

$$x_i = \sigma_i(\mathbf{z}_{1:i-1}) \cdot z_i + \mu_i(\mathbf{z}_{1:i-1}).$$

$$z_i = (x_i - \mu_i(\mathbf{z}_{1:i-1})) \cdot \frac{1}{\sigma_i(\mathbf{z}_{1:i-1})}.$$

- ▶ Sampling is fast.
- ▶ Density estimation is slow (sequential).

Papamakarios G., Pavlakou T., Murray I. Masked Autoregressive Flow for Density Estimation, 2017

MAF vs IAF

Theorem

Training a MAF with maximum likelihood corresponds to fitting an implicit IAF with stochastic variational inference where the posterior is taken to be the base density $\pi(\mathbf{z})$:

$$\max_{\theta} p(\mathbf{X}|\theta) \quad \Leftrightarrow \quad \min_{\theta} KL(p(\mathbf{z}|\theta) || \pi(\mathbf{z})).$$

- ▶ $\pi(\mathbf{z})$ is a base distribution; $\pi(\mathbf{x})$ is a data distribution.
- ▶ $\mathbf{z} = f(\mathbf{x}, \theta)$ – MAF model; $\mathbf{x} = g(\mathbf{z}, \theta)$ – IAF model.

$$\log p(\mathbf{z}|\theta) = \log \pi(g(\mathbf{z}, \theta)) + \log \left| \det \left(\frac{\partial g(\mathbf{z}, \theta)}{\partial \mathbf{z}} \right) \right|$$

$$\log p(\mathbf{x}|\theta) = \log \pi(f(\mathbf{x}, \theta)) + \log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right|$$

MAF vs IAF

Theorem

Training a MAF with maximum likelihood corresponds to fitting an implicit IAF with stochastic variational inference where the posterior is taken to be the base density $\pi(\mathbf{z})$:

$$\max_{\theta} p(\mathbf{X}|\theta) \quad \Leftrightarrow \quad \min_{\theta} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})).$$

Proof

$$\begin{aligned} KL(p(\mathbf{z}|\theta)||\pi(\mathbf{z})) &= \mathbb{E}_{p(\mathbf{z}|\theta)} [\log p(\mathbf{z}|\theta) - \log \pi(\mathbf{z})] = \\ &= \mathbb{E}_{p(\mathbf{z}|\theta)} \left[\log \pi(g(\mathbf{z}, \theta)) + \log \left| \det \left(\frac{\partial g(\mathbf{z}, \theta)}{\partial \mathbf{z}} \right) \right| - \log \pi(\mathbf{z}) \right] = \\ &= \mathbb{E}_{\pi(\mathbf{x})} \left[\log \pi(\mathbf{x}) - \log \left| \det \left(\frac{\partial f(\mathbf{x}, \theta)}{\partial \mathbf{x}} \right) \right| - \log \pi(f(\mathbf{x}, \theta)) \right]. \end{aligned}$$

MAF vs IAF

Proof (continued)

$$\begin{aligned} KL(p(\mathbf{z}|\boldsymbol{\theta})||\pi(\mathbf{z})) &= \\ &= \mathbb{E}_{\pi(\mathbf{x})} \left[\log \pi(\mathbf{x}) - \log \left| \det \left(\frac{\partial f(\mathbf{x}, \boldsymbol{\theta})}{\partial \mathbf{x}} \right) \right| - \log \pi(f(\mathbf{x}, \boldsymbol{\theta})) \right] = \\ &= \mathbb{E}_{\pi(\mathbf{x})} [\log \pi(\mathbf{x}) - \log p(\mathbf{x}|\boldsymbol{\theta})] = KL(\pi(\mathbf{x})||p(\mathbf{x}|\boldsymbol{\theta})). \end{aligned}$$

$$\begin{aligned} \arg \min_{\boldsymbol{\theta}} KL(\pi(\mathbf{x})||p(\mathbf{x}|\boldsymbol{\theta})) &= \arg \min_{\boldsymbol{\theta}} \mathbb{E}_{\pi(\mathbf{x})} [\log \pi(\mathbf{x}) - \log p(\mathbf{x}|\boldsymbol{\theta})] \\ &= \arg \max_{\boldsymbol{\theta}} \mathbb{E}_{\pi(\mathbf{x})} \log p(\mathbf{x}|\boldsymbol{\theta}) \end{aligned}$$

Unbiased estimator is MLE:

$$\mathbb{E}_{\pi(\mathbf{x})} \log p(\mathbf{x}|\boldsymbol{\theta}) = \sum_{i=1}^n \log p(\mathbf{x}_i|\boldsymbol{\theta}).$$

MAF vs IAF vs RealNVP

MAF

$$\mathbf{x} = \hat{\sigma}(\mathbf{x}) \odot \mathbf{z} + \hat{\mu}(\mathbf{x}).$$

- ▶ Calculating the density $p(\mathbf{x}|\theta)$ - 1 pass.
- ▶ Sampling - m passes.

IAF

$$\mathbf{x} = \sigma(\mathbf{z}) \odot \mathbf{z} + \mu(\mathbf{z}).$$

- ▶ Calculating the density $p(\mathbf{x}|\theta)$ - m passes.
- ▶ Sampling - 1 pass.

RealNVP

$$\mathbf{x}_{1:d} = \mathbf{z}_{1:d};$$

$$\mathbf{x}_{d:m} = \mathbf{z}_{d:m} \odot \exp(c_1(\mathbf{z}_{1:d}, \theta)) + c_2(\mathbf{x}_{1:d}, \theta).$$

MAF vs IAF vs RealNVP

RealNVP

$$\mathbf{x}_{1:d} = \mathbf{z}_{1:d};$$

$$\mathbf{x}_{d:m} = \mathbf{z}_{d:m} \odot \exp(c_1(\mathbf{z}_{1:d}, \boldsymbol{\theta})) + c_2(\mathbf{x}_{1:d}, \boldsymbol{\theta}).$$

- ▶ Calculating the density $p(\mathbf{x}|\boldsymbol{\theta})$ - 1 pass.
- ▶ Sampling - 1 pass.

RealNVP is a special case of MAF and IAF:

MAF

$$\begin{cases} \hat{\mu}_i = \hat{\sigma}_i = 0, i = 1, \dots, d; \\ \hat{\mu}_i, \hat{\sigma}_i - \text{functions of } \mathbf{x}_{1:d}, i = d + 1, \dots, m. \end{cases}$$

IAF

$$\begin{cases} \mu_i = \sigma_i = 0, i = 1, \dots, d; \\ \mu_i, \sigma_i - \text{functions of } \mathbf{z}_{1:d}, i = d + 1, \dots, m. \end{cases}$$

MAF/IAF pros and cons

MAF

- ▶ Sampling is slow.
- ▶ Likelihood evaluation is fast.

IAF

- ▶ Sampling is fast.
- ▶ Likelihood evaluation is slow.

How to take the best of both worlds?

WaveNet (2016)

Autoregressive model for raw audio waveforms generation

$$p(\mathbf{x}|\boldsymbol{\theta}) = \prod_{t=1}^T p(x_t|\mathbf{x}_{1:t-1}, \boldsymbol{\theta}).$$

The model uses causal dilated convolutions.

Parallel WaveNet, 2017

Previous WaveNet model

- ▶ raw audio is high-dimensional (e.g. 16000 samples per second for 16kHz audio);
- ▶ WaveNet encodes 8-bit signal with 256-way categorical distribution.

Goal

- ▶ improved fidelity (24kHz instead of 16kHz) → increase dilated convolution filter size from 2 to 3;
- ▶ 16-bit signals → mixture of logistics instead of categorical distribution.

Parallel WaveNet, 2017

Probability density distillation

1. Train usual WaveNet (MAF) via MLE (teacher network).
2. Train IAF WaveNet model (student network), which attempts to match the probability of its own samples under the distribution learned by the teacher.

Student objective

$$KL(p_s || p_t) = H(p_s, p_t) - H(p_s).$$

More than 1000x speed-up relative to original WaveNet!

Parallel WaveNet, 2017

Summary

- ▶ Flows is a continuous model. To use it for discrete distribution, the data should be dequantized.
- ▶ Original VAE model has lot of limitations. One of them is a restricted class of variational posteriors.
- ▶ Using flows in a latent space of VAE could give more flexible posterior distribution.
- ▶ Gaussian autoregressive model is a special type of flow (RealNVP model is a special type of this autoregressive model)
- ▶ MAF is an example of such model which is suitable for density estimation tasks.
- ▶ IAF used the inverse autoregressive transformation for variational inference task.

VAE limitations

- ▶ Poor variational posterior distribution (encoder)

$$q(\mathbf{z}|\mathbf{x}, \phi) = \mathcal{N}(\mathbf{z}|\boldsymbol{\mu}_{\phi}(\mathbf{x}), \boldsymbol{\sigma}_{\phi}^2(\mathbf{x})).$$

- ▶ Poor prior distribution

$$p(\mathbf{z}) = \mathcal{N}(0, \mathbf{I}).$$

- ▶ Poor probabilistic model (decoder)

$$p(\mathbf{x}|\mathbf{z}, \theta) = \mathcal{N}(\mathbf{x}|\boldsymbol{\mu}_{\theta}(\mathbf{z}), \boldsymbol{\sigma}_{\theta}^2(\mathbf{z})).$$

- ▶ Loose lower bound

$$p(\mathbf{x}|\theta) - \mathcal{L}(q, \theta) = (?).$$

$$\mathcal{L}(q, \theta) = \int q(\mathbf{Z}|\mathbf{X}) \log \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z}|\mathbf{X})} d\mathbf{Z}.$$

ELBO interpretations

- ▶ Evidence minus posterior KL

$$\mathcal{L}(q, \theta) = \log p(\mathbf{X}|\theta) - KL(q(\mathbf{Z}|\mathbf{X})||p(\mathbf{Z}|\mathbf{X}, \theta)).$$

- ▶ Average negative energy plus entropy

$$\mathcal{L}(q, \theta) = \mathbb{E}_{q(\mathbf{Z}|\mathbf{X})} p(\mathbf{X}, \mathbf{Z}|\theta) + \mathbb{H}[q(\mathbf{Z}|\mathbf{X})].$$

- ▶ Average term-by-term reconstruction minus KL to prior

$$\mathcal{L}(q, \theta) = \frac{1}{n} \sum_{i=1}^n \left[\mathbb{E}_{q(\mathbf{z}_i|\mathbf{x}_i)} \log p(\mathbf{x}_i|\mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i)) \right].$$

$$\mathcal{L}(q, \theta) = \frac{1}{n} \sum_{i=1}^n [\mathbb{E}_{q(\mathbf{z}_i|\mathbf{x}_i)} \log p(\mathbf{x}_i|\mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i))] .$$

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i|\mathbf{x}_i)||p(\mathbf{z}_i)) = KL(q(\mathbf{z})||p(\mathbf{z})) + \mathbb{I}_{q(i,\mathbf{z})}[i, \mathbf{z}],$$

where i is treated as random variable:

$$q(i, \mathbf{z}) = q(i)q(\mathbf{z}|i); \quad p(i, \mathbf{z}) = p(i)p(\mathbf{z}); \quad q(i) = p(i) = \frac{1}{n}; \quad q(\mathbf{z}|i) = q(\mathbf{z}|\mathbf{x}_i).$$

$$q(\mathbf{z}) = \sum_{i=1}^n q(i, \mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z}|\mathbf{x}_i); \quad \mathbb{I}_{q(i,\mathbf{z})}[i, \mathbf{z}] = \mathbb{E}_{q(i,\mathbf{z})} \log \frac{q(i, \mathbf{z})}{q(i)q(\mathbf{z})}.$$

ELBO surgery, 2016

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

Proof

$$\begin{aligned} \frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) &= \sum_{i=1}^n \int q(i) q(\mathbf{z} | i) \log \frac{q(\mathbf{z} | i)}{p(\mathbf{z})} d\mathbf{z} = \\ &= \sum_{i=1}^n \int q(i, \mathbf{z}) \log \frac{q(i, \mathbf{z})}{p(\mathbf{z}) p(i)} d\mathbf{z} = \int \sum_{i=1}^n q(i, \mathbf{z}) \log \frac{q(\mathbf{z}) q(i | \mathbf{z})}{p(\mathbf{z}) p(i)} d\mathbf{z} = \\ &= \int q(\mathbf{z}) \log \frac{q(\mathbf{z})}{p(\mathbf{z})} d\mathbf{z} + \int \sum_{i=1}^n q(i | \mathbf{z}) q(\mathbf{z}) \log \frac{q(i | \mathbf{z})}{p(i)} d\mathbf{z} = \\ &= KL(q(\mathbf{z}) || p(\mathbf{z})) - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})] + \log n. \end{aligned}$$

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

Proof (continued)

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})] + \log n$$

$$\begin{aligned} \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}] &= \mathbb{E}_{q(i, \mathbf{z})} \log \frac{q(i, \mathbf{z})}{q(i)q(\mathbf{z})} = \mathbb{E}_{q(\mathbf{z})} \mathbb{E}_{q(i | \mathbf{z})} \log \frac{q(i | \mathbf{z})q(\mathbf{z})}{q(i)q(\mathbf{z})} = \\ &= \mathbb{E}_{q(\mathbf{z})} \mathbb{E}_{q(i | \mathbf{z})} \log \frac{q(i | \mathbf{z})}{q(i)} = -\mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})] + \log n. \end{aligned}$$

ELBO surgery, 2016

Theorem

$$\frac{1}{n} \sum_{i=1}^n KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i)) = KL(q(\mathbf{z}) || p(\mathbf{z})) + \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}].$$

ELBO revisiting

$$\begin{aligned} \mathcal{L}(q, \theta) &= \frac{1}{n} \sum_{i=1}^n [\mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta) - KL(q(\mathbf{z}_i | \mathbf{x}_i) || p(\mathbf{z}_i))] = \\ &= \frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta) - \mathbb{I}_{q(i, \mathbf{z})}[i, \mathbf{z}] - KL(q(\mathbf{z}) || p(\mathbf{z})) = \\ &= \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log n - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log n} - \underbrace{KL(q(\mathbf{z}) || p(\mathbf{z}))}_{\text{Marginal KL}} \end{aligned}$$

ELBO revisiting

$$\mathcal{L}(q, \theta) = \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log n - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log n} - \underbrace{KL(q(\mathbf{z}) || p(\mathbf{z}))}_{\text{Marginal KL}}$$

$$KL(q(\mathbf{z}) || p(\mathbf{z})) = 0 \quad \Leftrightarrow \quad p(\mathbf{z}) = q(\mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z} | \mathbf{x}_i).$$

	ELBO	Avg. KL	Mutual info. ②	Marg. KL ③
2D latents	-129.63	7.41	7.20	0.21
10D latents	-88.95	19.17	10.82	8.35
20D latents	-87.45	20.2	10.67	9.53

$$\log n \approx 11.0021$$

Hoffman M. D., Johnson M. J. *ELBO surgery: yet another way to carve up the variational evidence lower bound*, 2016

ELBO revisiting

$$\mathcal{L}(q, \theta) = \underbrace{\frac{1}{n} \sum_{i=1}^n \mathbb{E}_{q(\mathbf{z}_i | \mathbf{x}_i)} \log p(\mathbf{x}_i | \mathbf{z}_i, \theta)}_{\text{Reconstruction loss}} - \underbrace{(\log n - \mathbb{E}_{q(\mathbf{z})} \mathbb{H}[q(i | \mathbf{z})])}_{0 \leq \text{Mutual info} \leq \log N} - \underbrace{KL(q(\mathbf{z}) || p(\mathbf{z}))}_{\text{Marginal KL}}$$

How to choose the optimal $p(\mathbf{z})$?

- ▶ SG: $p(\mathbf{z}) = \mathcal{N}(0, I) \Rightarrow$ over-regularization;
- ▶ MoG: $p(\mathbf{z} | \boldsymbol{\lambda}) = \frac{1}{K} \sum_{k=1}^K \mathcal{N}(\boldsymbol{\mu}_k, \boldsymbol{\sigma}_k^2) \Rightarrow (*), (**);$
- ▶ $p(\mathbf{z}) = q(\mathbf{z}) = \frac{1}{n} \sum_{i=1}^n q(\mathbf{z} | \mathbf{x}_i) \Rightarrow$ overfitting and highly expensive.
